This is a joint work with

- ▶ S. T. Chapman, (Trinity)
- ▶ P. A. García-Sánchez (Granada)

To appear in

Forum Mathematicum

Set of factorizations

- ▶ Let $S = \langle n_1, \dots, n_p \rangle$ be a **numerical monoid** minimally generated by $n_1 < n_2 < \dots < n_p$.
- ▶ For every $s \in S$, we define the **set of factorizations** of s

$$Z(s) = \{(a_1, \dots, a_p) \in \mathbb{N}^p : a_1 n_1 + \dots + a_p n_p = s\}$$

Set of factorizations

- ▶ Let $S = \langle n_1, \dots, n_p \rangle$ be a **numerical monoid** minimally generated by $n_1 < n_2 < \dots < n_p$.
- ▶ For every $s \in S$, we define the **set of factorizations** of s

$$Z(s) = \{(a_1, \dots, a_p) \in \mathbb{N}^p : a_1 n_1 + \dots + a_p n_p = s\}$$

Support

Let $a = (a_1, \dots, a_p) \in \mathbb{Z}^p$ We define the **support** of a as:

$$\text{supp}(a) = \{i : a_i \neq 0\}$$

Set of factorizations

- ▶ Let $S = \langle n_1, \dots, n_p \rangle$ be a **numerical monoid** minimally generated by $n_1 < n_2 < \dots < n_p$.
- ▶ For every $s \in S$, we define the **set of factorizations** of s

$$Z(s) = \{(a_1, \dots, a_p) \in \mathbb{N}^p : a_1 n_1 + \dots + a_p n_p = s\}$$

Distance

- ▶ For $z = (z_1, \dots, z_p) \in \mathbb{Z}^p$ we define its **norm**:

$$|z| = \max\left\{\sum_{z_i > 0} z_i, \sum_{z_i < 0} |z_i|\right\}$$

The **length** of a factorization $a \in \mathbb{N}^p$ is $|a|$.

- ▶ For $a, b \in \mathbb{N}^p$ we define the **distance** between a and b as

$$d(a, b) = |a - b|$$

Distance is the main tool in this work. The catenary degree tries to control the distance between all different factorizations of the elements of S .

Catenary degree

Given $s \in S$ and $a, b \in Z(s)$, then an **N -chain of factorizations** from a to b is a sequence $a = a^1, \dots, a^t = b$, $a^i \in Z(s)$ such that $d(a^i, a^{i+1}) \leq N$ for all i .

The **catenary degree** of s , $c(s)$, is the minimal $N \in \mathbb{N} \cup \{\infty\}$ such that for any two factorizations $a, b \in Z(s)$, there is an N -chain from a to b .

The catenary degree of S is $c(S) = \sup\{c(s) : s \in S\}$.

The catenary degree of an element

Let $S = \langle 6, 9, 11 \rangle$

$$Z(42) = \{(0, 1, 3), (1, 4, 0), (4, 2, 0), (7, 0, 0)\}$$

The catenary degree of an element

Let $S = \langle 6, 9, 11 \rangle$

$$Z(42) = \{(0, 1, 3), (1, 4, 0), (4, 2, 0), (7, 0, 0)\}$$

The catenary degree of an element

Let $S = \langle 6, 9, 11 \rangle$

$$Z(42) = \{(0, 1, 3), (1, 4, 0), (4, 2, 0), (7, 0, 0)\}$$

$$\begin{array}{ccc}
 (0, 1, 3) & \xrightarrow{4} & (1, 4, 0) \\
 & \begin{array}{c} \diagdown \quad \diagup \\ 7 \end{array} & \\
 \begin{array}{c} | \\ 5 \end{array} & & \begin{array}{c} | \\ 6 \end{array} \\
 (4, 2, 0) & \xrightarrow{3} & (7, 0, 0) \\
 & \begin{array}{c} \diagup \quad \diagdown \\ 3 \end{array} &
 \end{array}$$

The catenary degree of an element

Let $S = \langle 6, 9, 11 \rangle$

$$Z(42) = \{(0, 1, 3), (1, 4, 0), (4, 2, 0), (7, 0, 0)\}$$

$$\begin{array}{ccc}
 (0, 1, 3) & \xrightarrow{4} & (1, 4, 0) \\
 | 5 & \nearrow 3 & | 6 \\
 (4, 2, 0) & \xrightarrow{3} & (7, 0, 0)
 \end{array}$$

The catenary degree of an element

Let $S = \langle 6, 9, 11 \rangle$

$$Z(42) = \{(0, 1, 3), (1, 4, 0), (4, 2, 0), (7, 0, 0)\}$$

$$\begin{array}{ccc}
 (0, 1, 3) & \xrightarrow{4} & (1, 4, 0) \\
 & \begin{array}{c} | \\ \diagdown \\ \diagup \end{array} & \\
 & 5 & 3 \\
 (4, 2, 0) & \xrightarrow{3} & (7, 0, 0)

The catenary degree of an element

Let $S = \langle 6, 9, 11 \rangle$

$$Z(42) = \{(0, 1, 3), (1, 4, 0), (4, 2, 0), (7, 0, 0)\}$$

$$\begin{array}{ccc}
 (0, 1, 3) & \xrightarrow{4} & (1, 4, 0) \\
 & \nearrow & \\
 (4, 2, 0) & \xrightarrow{3} & (7, 0, 0)
 \end{array}$$

So

$$C(42) = 4$$

The Tool

\mathcal{R} -classes

Let $s \in S$ and $a, b \in Z(s)$ be two factorizations of s . We say that both factorizations are **related** $a\mathcal{R}b$ if there exists a sequence $a = a^1, \dots, a^t = b$, $a^i \in Z(s)$ such that $\text{supp}(a^i) \cap \text{supp}(a^{i+1}) \neq \emptyset$.

The Tool

\mathcal{R} -classes

Let $s \in S$ and $a, b \in Z(s)$ be two factorizations of s . We say that both factorizations are **related** $a\mathcal{R}b$ if there exists a sequence $a = a^1, \dots, a^t = b$, $a^i \in Z(s)$ such that $\text{supp}(a^i) \cap \text{supp}(a^{i+1}) \neq \emptyset$.

Proposition

The distance between elements a and b in different \mathcal{R} -classes is $d(a, b) = \max\{|a|, |b|\}$.

We can control the elements with more than one \mathcal{R} -class.

Apéry set

- ▶ For every n_i we define the **Apéry set** of S respect to n_i as

$$Ap(S, n_i) = \{s \in S : s - n_i \notin S\}$$

- ▶ $Ap(S, n_i) = \{w(0), w(1), \dots, w(n_i-1)\}$ with $w(j)$ the least element in S congruent with j modulo n_i

Apéry set

- ▶ For every n_i we define the **Apéry set** of S respect to n_i as

$$Ap(S, n_i) = \{s \in S : s - n_i \notin S\}$$

- ▶ $Ap(S, n_i) = \{w(0), w(1), \dots, w(n_i-1)\}$ with $w(j)$ the least element in S congruent with j modulo n_i

Important Result

The elements of S with more than one \mathcal{R} -class are of the form $w + n_j$ where $w \in Ap(S, n_1)$ and $j = 2, \dots, p$.

$Z(bn_1)$ has two (o more) factorizations:

$$(b, 0, \dots, 0) \text{ and } (0, a_2, \dots, a_p) \text{ such that } \sum_{i=2}^p a_i n_i = bn_1$$

We can ensure that do not exist factorizations of bn_1 joining those given above, because of the minimality of b .

The above is equivalent to say that $bn_1 - n_1 - n_i \notin S$

We see next examples in which this bound is reached.

Generated by arithmetic sequences

From now on, we consider $S = \langle a, a + d, \dots, a + cd \rangle$ with $1 \leq c < a$ and $\gcd(a, d) = 1$.

Main theorem

$$c(S) = \left\lceil \frac{a}{c} \right\rceil + d$$

Where $\lceil q \rceil = \min\{n \in \mathbb{N} : n \geq q\}$

Sketch of the proof

First, we control membership to S and the factorizations of the elements in the Apéry set of the multiplicity

The elements

Every element in S can be written as $ka + rd$.

Note that ad can be appear as d times a or a times d .

So we can assume that $r < a$. This will be the key for the following.

The elements

Every element in S can be written as $ka + rd$.

Note that ad can be appear as d times a or a times d .

So we can assume that $r < a$. This will be the key for the following.

If $r < a$,

$$n = ka + rd \in S \Leftrightarrow 0 \leq r \leq kc$$

In the minimal case n is multiple of a . In the maximal case n is multiple of $a + cd$.

Apery Set in arithmetic sequences

Let $w \in \text{Ap}(S, a)$ and let $z \in Z(w)$. Then

$$|z| \leq \left\lceil \frac{a}{c} \right\rceil$$

Factorizations of elements with more than one \mathcal{R} -class

Let $n = w + (a + jd)$ with $w \in \text{Ap}(S, a)$ and $j \in \{1, \dots, c\}$. If $z \in Z(n)$ then $|z| \leq \left\lceil \frac{a}{c} \right\rceil + d + 1$

Hence

$$c(S) \leq \left\lceil \frac{a}{c} \right\rceil + d + 1$$

Besides recall that that

$$\min\{k \in \mathbb{N} - \{0\} : ka \in \langle a + d, \dots, a + cd \rangle\} \leq c(\mathbb{S})$$

Computing this bound

$$\min\{k \in \mathbb{N} - \{0\} : ka \in \langle a + d, \dots, a + cd \rangle\} = \left\lceil \frac{a}{c} \right\rceil + d$$

Thus

$$\left\lceil \frac{a}{c} \right\rceil + d \leq c(\mathbf{S}) \leq \left\lceil \frac{a}{c} \right\rceil + d + 1$$

Besides recall that that

$$\min\{k \in \mathbb{N} - \{0\} : ka \in \langle a + d, \dots, a + cd \rangle\} \leq c(\mathbf{S})$$

Computing this bound

$$\min\{k \in \mathbb{N} - \{0\} : ka \in \langle a + d, \dots, a + cd \rangle\} = \left\lceil \frac{a}{c} \right\rceil + d$$

Thus

$$\left\lceil \frac{a}{c} \right\rceil + d \leq c(\mathbf{S}) \leq \left\lceil \frac{a}{c} \right\rceil + d + 1$$

The bound is tight

Now to finish the proof of main theorem. We only need to prove that $c(\mathbf{S}) \neq \left\lceil \frac{a}{c} \right\rceil + d + 1$

A new result. Generalized arithmetic sequences

Omidali has been to proof that if $S = \langle a, ha + d, \dots, ha + cd \rangle$ then:

$$c(S) = \left\lceil \frac{a}{c} \right\rceil h + d$$
