Let S and T be monoids. A **relational morphism** of monoids $\tau : S \to T$ is a function from S into $\mathcal{P}(T)$, the power set of T, such that:

- for all $s \in S, \ \tau(s) \neq \emptyset$;
- for all $s_1, s_2 \in S$, $\tau(s_1)\tau(s_2) \subseteq \tau(s_1s_2)$;
- $1 \in \tau(1)$.

Definitions	Consequences	Motivation	On the algorithms	Relative kernels of groups	Solvability
00	00	00	000000	000	000

It follows that $e \in \tau^{-1}(1)$. If $x, y \in \tau^{-1}(1)$, then $1 \in \tau(x)\tau(y) \subseteq \tau(xy)$, therefore $xy \in \tau^{-1}(1)$, thus $\tau^{-1}(1)$ is a subsemigroup of S containing the idempotents. As the non-empty intersection of subsemigroups is a subsemigroup, we have the following fact.

Definitions	Consequences	Motivation	On the algorithms	Relative kernels of groups	Solvability
00	00	00	0000000	000	000

It follows that $e \in \tau^{-1}(1)$. If $x, y \in \tau^{-1}(1)$, then $1 \in \tau(x)\tau(y) \subseteq \tau(xy)$, therefore $xy \in \tau^{-1}(1)$, thus $\tau^{-1}(1)$ is a subsemigroup of S containing the idempotents. As the non-empty intersection of subsemigroups is a subsemigroup, we have the following fact.

Fact 2.4

Let H be a pseudovariety of groups and let M be a finite monoid. The relative kernel $K_H(M)$ is a submonoid of M containing the idempotents.

Definitions	Consequences	Motivation	On the algorithms	Relative kernels of groups	Solvability
00	00	00	0000000	000	000

It follows that $e \in \tau^{-1}(1)$. If $x, y \in \tau^{-1}(1)$, then $1 \in \tau(x)\tau(y) \subseteq \tau(xy)$, therefore $xy \in \tau^{-1}(1)$, thus $\tau^{-1}(1)$ is a subsemigroup of *S* containing the idempotents. As the non-empty intersection of subsemigroups is a subsemigroup, we have the following fact.

Fact 2.4

Let H be a pseudovariety of groups and let M be a finite monoid. The relative kernel $K_H(M)$ is a submonoid of M containing the idempotents.

Fact 2.3 may be used to determine elements in the H-kernel of a monoid without its complete determination.

Definitions	Consequences	Motivation	On the algorithms	Relative kernels of groups	Solvability
00	00	00	0000000	000	000

It follows that $e \in \tau^{-1}(1)$. If $x, y \in \tau^{-1}(1)$, then $1 \in \tau(x)\tau(y) \subseteq \tau(xy)$, therefore $xy \in \tau^{-1}(1)$, thus $\tau^{-1}(1)$ is a subsemigroup of *S* containing the idempotents. As the non-empty intersection of subsemigroups is a subsemigroup, we have the following fact.

Fact 2.4

Let H be a pseudovariety of groups and let M be a finite monoid. The relative kernel $K_H(M)$ is a submonoid of M containing the idempotents.

Fact 2.3 may be used to determine elements in the H-kernel of a monoid without its complete determination.

Definitions	Consequences	Motivation	On the algorithms	Relative kernels of groups	Solvability
00	0•	00	0000000	000	000

It follows that $e \in \tau^{-1}(1)$. If $x, y \in \tau^{-1}(1)$, then $1 \in \tau(x)\tau(y) \subseteq \tau(xy)$, therefore $xy \in \tau^{-1}(1)$, thus $\tau^{-1}(1)$ is a subsemigroup of S containing the idempotents. As the non-empty intersection of subsemigroups is a subsemigroup, we have the following fact.

Fact 2.4

Let H be a pseudovariety of groups and let M be a finite monoid. The relative kernel $K_H(M)$ is a submonoid of M containing the idempotents.

Fact 2.3 may be used to determine elements in the H-kernel of a monoid without its complete determination.

Note that, for example, if we can determine a set X of generators of a monoid M such that $X \subseteq K_H(M)$, then we can conclude by Fact 2.4 that the $M = \langle X \rangle \subseteq K_H(M)$.

00	00	00	000000	000	000

Let G be a finite group. Denote by $N_{\overline{p}}$ the normal subgroup of G generated by $\{x \in G : p \nmid \text{ord } x\}$.

Lemma 5.2

Let $f : G \to H$ be a homomorphism from G into a finite p-group H and let $x \in G$. If $p \nmid \operatorname{ord} x$, then f(x) = 1.

Proof.

Let $n = \operatorname{ord} f(x)$. Since f is a homomorphism, we have that $n | \operatorname{ord} x$, and therefore $p \nmid n$. But, as f(x) belongs to a *p*-group, *p* must divide *n*, unless n = 1. Thus $\operatorname{ord} f(x) = 1$, which implies f(x) = 1.

Definitions	Consequences	Motivation	On the algorithms	Relative kernels of groups	Solvability
00	00	00	0000000	000	000
Thee	Kama E 2				
Theo	rem 5.5				
		ľ	$S_G(G) = N_{\overline{n}}$		

Proof.

Let $x \in G$ and suppose that $p \nmid \operatorname{ord} x$. Since to compute a relative kernel of a group it suffices to consider homomorphisms, it follows from the above lemma that $x \in K_{G_p}(G)$. Therefore, $K_{G_p}(G) \supseteq N_{\overline{p}}$. For the converse, it suffices to note that the quotient $G/N_{\overline{p}}$ is a *p*-group and to use Proposition 2.1. Let $x \in G/N_{\overline{p}}$. If $p \nmid \operatorname{ord} x$, then $xN_{\overline{p}} = N_{\overline{p}}$. Suppose that $\operatorname{ord} x = p^{\alpha}k$, where α is the greatest power of p such that $p^{\alpha} \mid \operatorname{ord} x$. By observing that $x^{p^{\alpha}} \in N_{\overline{p}}$, we conclude that the order of $xN_{\overline{p}}$ divides p^{α} , thus is a power of p.

$\mathsf{V} \, {}^n\!\widehat{}_{\!\!\mathcal{m}} \, \mathsf{H} = \{ S \mid \mathsf{K}^{\mathit{n}}_\mathsf{H}(S) \in \mathsf{V} \} \text{ and } \mathsf{V} \, {}^\omega\!\widehat{}_{\!\!\mathcal{m}} \mathsf{H} = \{ S \mid \mathsf{K}^{\omega}_\mathsf{H}(S) \in \mathsf{V} \}.$

In a joint work with Fernandes (2005), a semigroup was defined to be H-**solvable** if iterating the H-kernel operator eventually arrives at the subsemigroup generated by the idempotents.

It is e	asy to see				

$\mathsf{V} \stackrel{n}{\textcircled{\tiny{}}} \mathsf{M} = \{ S \mid \mathsf{K}^{n}_{\mathsf{H}}(S) \in \mathsf{V} \} \text{ and } \mathsf{V} \stackrel{\omega}{\textcircled{\tiny{}}} \mathsf{M} = \{ S \mid \mathsf{K}^{\omega}_{\mathsf{H}}(S) \in \mathsf{V} \}.$

In a joint work with Fernandes (2005), a semigroup was defined to be H-**solvable** if iterating the H-kernel operator eventually arrives at the subsemigroup generated by the idempotents.

A semigroup with commuting idempotents has been proved to be Ab-solvable if and only if its subgroups are solvable groups.

A semigroup with commuting idempotents has been proved to be Ab-solvable if and only if its subgroups are solvable groups.

A much more general result has then been obtained in a joint work with Fernandes, Margolis and Steinberg (2004). It states that:

for a non-trivial pseudovariety H of groups, a semigroup with an aperiodic idempotent-generated subsemigroup is H-solvable if and only if it subgroups are H-solvable.

We proved, in particular, that

$$\mathsf{E}\mathsf{A}=\mathsf{A}\,{}^\omega\!\!\textcircled{}_{}^{}_{}^{}_{}^{}_{}^{}\mathcal{G}$$

where we denote by EA the pseudovariety consisting of all monoids whose idempotents generate an aperiodic submonoid

We proved, in particular, that

$$\mathsf{E}\mathsf{A}=\mathsf{A}^{\,\omega}_{}\widehat{}_{}\mathfrak{M}\mathsf{G}$$

where we denote by EA the pseudovariety consisting of all monoids whose idempotents generate an aperiodic submonoid

By using a modification of the technique, it has been shown in a joint work with Steinberg that:

a semigroup S is H-solvable if and only if, for each idempotent $e \in S$, there is a subnormal series with smallest element the maximal subgroup at e of the idempotent-generated subsemigroup of S and largest element the maximal subgroup of S at e such that the successive quotients belong to H.
